## I. Overview and Description of the Application.

---

The project reduces the human efforts in maintaining piles of books manually which is highly tedious, inefficient, time-consuming and very error prone, because the overloaded work can lead to misplacing the collected information in papers. Thus the objective of the system is to maintain data properly.

The main objective of the system is to locate the exact transaction of the system being taken place without any errors in a well-computerized system. Master Reports with summary are generated which the management for taking quick decisions can view. Hence the computer system is ideal for maintaining and locating information of any volume related to the system at any time.

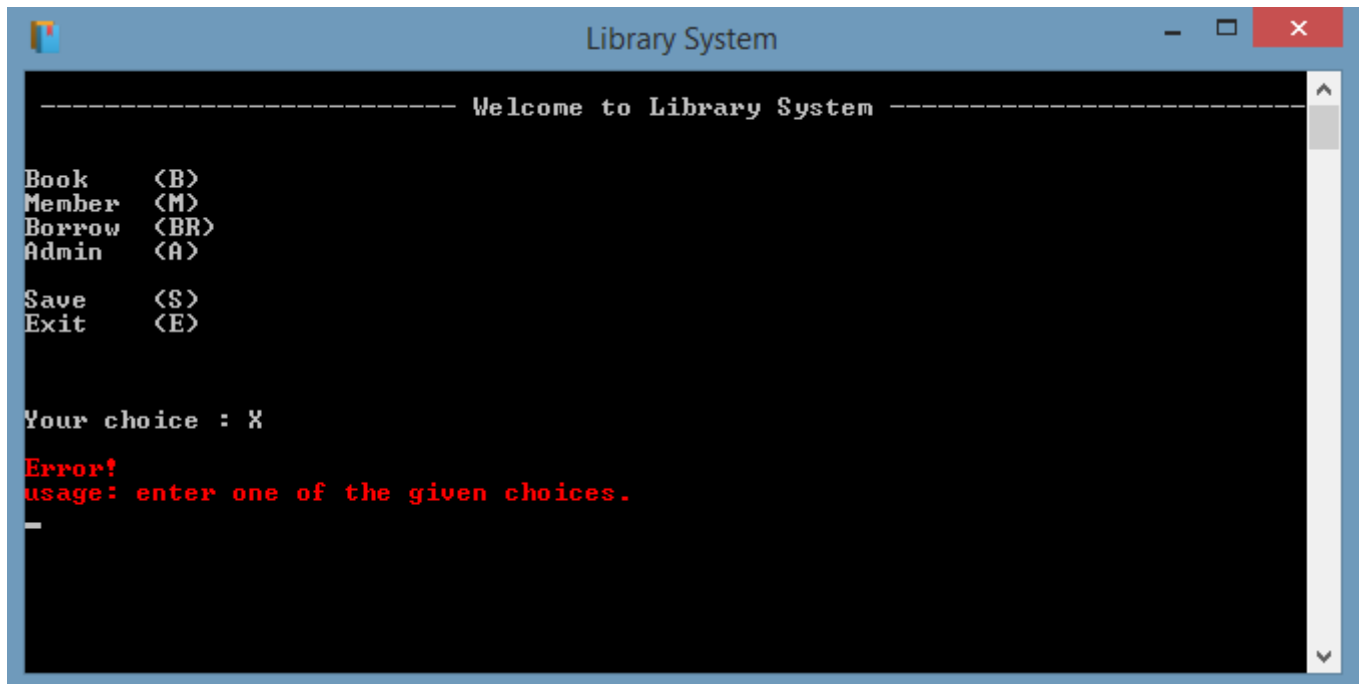

To assure high quality, several validations checks are performed on e-mail, phone number, date, blank entries, and illogical ones such like entering negative integers while adding new copies number for example. Also uniqueness of entered books' ISBN and members' ID are checked to avoid their repetition.

Several menus are provided to enable an easy access and navigation throughout functions. Multiple functions are added to facilitate the process of the system.

## II. Sample Runs.

---

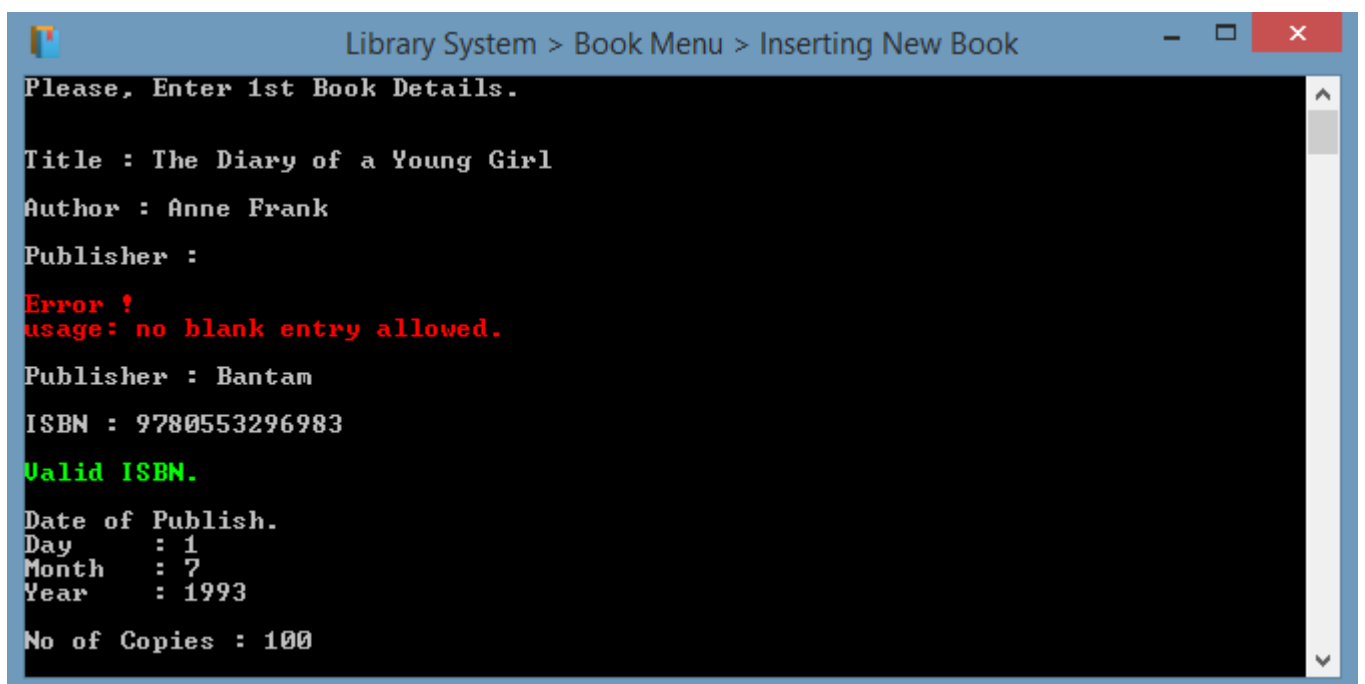

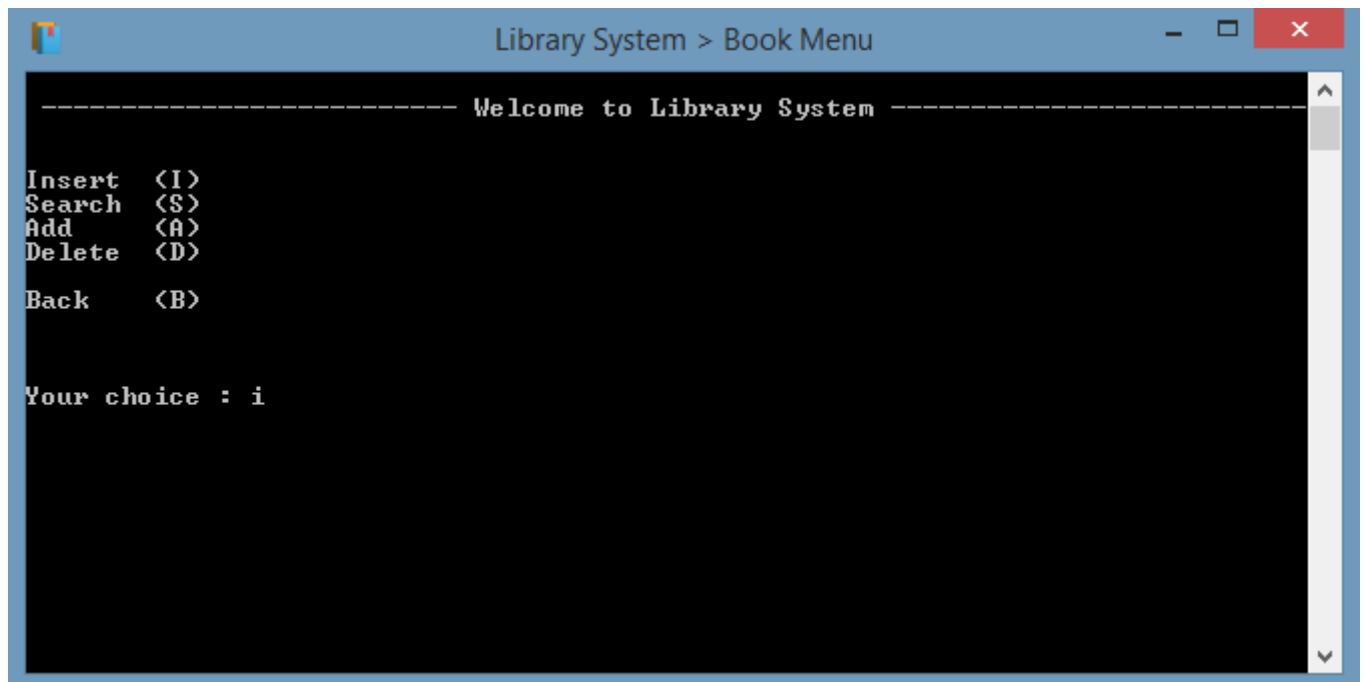

The screenshot shows a window titled "Library System" with a black terminal area. The terminal displays a welcome message, a menu of options with their corresponding keys, and a prompt for user choice. An invalid choice 'X' has been entered, resulting in a red error message.

```
----- Welcome to Library System -----  
Book      <B>  
Member    <M>  
Borrow    <BR>  
Admin     <A>  
  
Save      <S>  
Exit      <E>  
  
Your choice : X  
Error!  
usage: enter one of the given choices.  
-
```

The screenshot shows the same "Library System" window. This time, the user has entered 'S' as their choice, and the terminal displays a green message indicating that the data was saved successfully.

```
----- Welcome to Library System -----  
Book      <B>  
Member    <M>  
Borrow    <BR>  
Admin     <A>  
  
Save      <S>  
Exit      <E>  
  
Your choice : S  
Data saved successfully.  
-
```

### III. Pseudocode, Flowchart and Main Algorithms Used.

The shown flowchart below can be applied on any of the sub-menus provided since the concept of jumping through functions is the same for all sub-menus. Also, a check at the end is provided so that if any choice is entered which is not given, an error message appears and loops back to the beginning of the function.

## 1. Bubble Sort.

Bubble sort (*sometimes referred to as **sinking sort***) is a simple sorting algorithm that repeatedly steps through the list to be sorted, compares each pair of adjacent items and swaps them if they are in the wrong order. The pass through the list is repeated until no swaps are needed, which indicates that the list is sorted.

The algorithm is used in the program in the `mostPopularBooks()` function to sort all books according to their number of times being borrowed.

### Algorithm Information:

Class	Data Structure	Worst-Case	Best-Case	Average
Sorting Algorithm	Array	$O(n^2)$	$O(n)$	$O(n^2)$

### Implementation Pseudocode:

```
procedure bubbleSort( A : list of sortable items )
    n = length(A)
    for i = 0 to n - 1
        for j = 1 to n-1
            if A[j-1] > A[j] then
                swap( A[j-1], A[j] )
            end if
        end for
    end for
end procedure
```

## 2. Linear Search.

Linear search or sequential search is a method for finding a target value within a list. It sequentially checks each element of the list for the target value until a match is found or until all the elements have been searched.

The algorithm is used in the program in any function that needs to search into files.

Algorithm Information:

Class	Data Structure	Worst-Case	Best-Case	Average
Searching Algorithm	Data	$O(n)$	$O(1)$	$O(n)$

Implementation Pseudocode:

1. Set  $i$  to 0.
2. If  $L(i) = \text{Target}$ , the search terminates successfully and return  $i$ .
3. Increase  $i$  by 1.
4. If  $i < n$ , go to step 2. Otherwise, the search terminates unsuccessfully.

## IV. Description of Implemented Functions and Modules.

---

### 1. Main Function (*main.c*)

The function starts by initializing all old databases so that we can have the flexibility to erase all the progress done since the start of the program and reusing the old database instead of the current one.

`initTempDataBase()` will be discussed lately in the `utilities.h` header file. A loop is created to keep the program working and never stopping until the user asks to exit.

```
1.
2.     // adding header files
3.     #include <stdio.h>
4.     #include <stdbool.h>
5.     #include <windows.h>
6.
7.     // adding self-made header files
8.     #include "menu.h"
9.     #include "utilities.h"
10.
11.
12.     int main(void){
13.
14.         // load old database in a temp archive
15.         initTempDataBase();
16.
17.         do {
18.             mainMenu();
19.             fflush(stdin);
20.
21.             SetConsoleTitle("Library System > Exit ?");
22.
23.         } while( yesNoRequest("exit")==false );
24.
25.         return 0;
26.     }
```

## 2. Utilities Header File (*utilities.h*)

It's a header file which contains multiple functions that will be used all over the program. Starting by the implementation of `initTempDataBase()` which is previously mentioned. It has three functions invoked inside which are typically the same for: books, borrowed books and members.

```
1.
2. void initTempDataBase() {
3.
4.     initBookTempDataBase();
5.     initBorrowedBookTempDataBase();
6.     initMemberTempDataBase();
7. }
```

And here's an example of one of them, `initMemberTempDataBase()`

```
1.
2. void initMemberTempDataBase() {
3.
4.     memberDataType member;
5.
6.
7.     FILE * members = fopen("members.bin", "r");
8.
9.     // failure check
10.    if(members==NULL)
11.        return;
12.
13.    FILE * membersTempDataBase = fopen("membersTempDatabase.bin", "w");
14.
15.    // failure check
16.    if(membersTempDataBase==NULL)
17.        return;
18.
19.
20.    // read from original file
21.    while( fread(&member, sizeof(memberDataType), 1, members) ) {
22.
23.        // write into temporary file
24.        fwrite(&member, sizeof(memberDataType), 1, membersTempDataBase);
25.    }
26.
27.    fclose(members);
28.    fclose(membersTempDataBase);
29. }
```

A terminating function is needed to end the program and manage the extra ".bin" files and to close the program without any lose in data. Thus, `terminateTempDataBase( bool save )` is implemented.

```
1.
2. void terminateTempDataBase( bool save ) {
3.
4.     if(save) {
5.
6.         remove("booksTempDatabase.bin");
7.         remove("borrowedBooksTempDatabase.bin");
8.         remove("membersTempDatabase.bin");
9.     }
10.
11.
12.     // recover old database
13.     else {
14.
15.         remove("books.bin");
16.         remove("borrowed-books.bin");
17.         remove("members.bin");
18.
19.         rename("membersTempDatabase.bin" , "members.bin");
20.         rename("borrowedBooksTempDatabase.bin" , "borrowed-books.bin");
21.         rename("booksTempDatabase.bin" , "books.bin");
22.     }
23. }
```

Since yes-no questions are being asked in each and every function so it's better to implement a function that does this functionality. Thus, `yesNoQuestion( char * question)` is implemented. Where you write the question and the function then does it's work.

Also, entering an "yes" and "no" in lowercase or uppercase doesn't matter. Even entering other words which are not available is not a big deal since the program will warn you.

```
1.
2. bool yesNoRequest(char * question) {
3.
4.     // string instead of a char for run-time error
5.     char choice[5];
6.
7.     do{
8.         system("cls");
9.
10.        printf("\a\nDo you want to %s ? (Y/N) : ",question);
11.        gets(choice);
12.
13.        // converts string into uppercase
14.       strupr(choice);
15.
16.
17.        // exit
18.        if( strcmp(choice,"NO")==0 || strcmp(choice,"N")==0 )
19.            return false;
20.
21.        // cont
22.        else if(strcmp(choice,"YES")==0 || strcmp(choice,"Y")==0)
23.            return true;
24.
25.        else {
26.            fprintf(stderr, "\a\n\nError!
27.                        \nusage: enter one of the given choices.");
28.            getche();
29.        }
30.
31.    }while( strcmp(choice,"N")!=0 && strcmp(choice,"Y")!=0
32.            && strcmp(choice,"NO")!=0 && strcmp(choice,"YES")!=0 );
33. }
```

## Email validations:

```
1.
2. // check email validity
3. bool isEmail ( char * email ) {
4.
5.     int atSymbol=0;
6.     int topLevelDomain=0;
7.
8.     int i=0;
9.
10.    while(email[i]!='\0') {
11.
12.        // first elemnt in the email string can not be a digit
13.        if( email[1]>=0 && email[1]<=9 )
14.            return false;
15.
16.        else {
17.
18.            // only digits, lower alphabets, underscore,
19.            // dashed and dots are allowed
20.            if( !(email[i]>=0 && email[i]<=9 || email[i]>='a' && email[i]<='z'
21.                || email[i]< '_' || email[i]< '.' || email[i]< '-') )
22.                return false;
23.
24.            // two contiguous dashes or dots are not allowed
25.            if( (email[i]>='-' && email[i+1]<='-') || ( email[i]< '.'
26.                && email[i+1]< '.' ) )
27.                return false;
28.
29.            // incrementing atSymbol variable every time it appears
30.            if( email[i]>='a' && email[i]<='z' && email[i+1]=='@'
31.                && email[i+2]>='a' && email[i+2]<='z' )
32.                atSymbol++;
33.
34.            // incrementing topLevelDomain (.com) variable every time it appears
35.            if( email[i]=='.' && email[i+1]=='c' && email[i+2]=='o'
36.                && email[i+3]=='m' )
37.                topLevelDomain++;
38.
39.            if( atSymbol == 1 && topLevelDomain == 1 )
40.                return true;
41.        }
42.
43.        i++;
44.    }
45.
46.    return false;
47. }
```

## Leap year validations:

```
1.
2. // check leap validity
3. bool isLeap ( int year ) {
4.
5.     return ( (year%4==0) && (year%100!=0) ) || (year%400==0);
6. }
```

## Date validations:

```
1.
2. // check date validity
3. bool isDate ( int day, int month, int year ) {
4.
5.     // constants
6.     const int MAX_VALID_YEAR = 9999;
7.     const int MIN_VALID_YEAR = 0001;
8.
9.
10.    // year, month or day are not in given range
11.    if (year > MAX_VALID_YEAR || year < MIN_VALID_YEAR)
12.        return false;
13.
14.    if (month < 1 || month > 12)
15.        return false;
16.
17.    if (day < 1 || day > 31)
18.        return false;
19.
20.
21.    // february
22.    if (month == 2) {
23.
24.        if (isLeap(year))
25.            return (day <= 29);
26.
27.        else
28.            return (day <= 28);
29.    }
30.
31.
32.    // april, june, sept and nov, have number of days less than or equal to 30
33.    if (month==4 || month==6 || month==9 || month==11)
34.        return (day <= 30);
35.
36.    return true;
37. }
```

## Standard pop messages:

```
1.
2. // red error message
3. void errMsg ( char * message ) {
4.
5.     textcolor(LIGHTRED);
6.     fprintf(stderr, "\a\n%s.\n", message);
7.     textcolor(LIGHTGRAY);
8.     getch();
9. }
```

```
1.
2. // green acceptance message
3. void acpMsg ( char * message ) {
4.
5.     textcolor(LIGHTGREEN);
6.     printf("\a\n%s.\n", message);
7.     textcolor(LIGHTGRAY);
8.     getch();
9. }
```

## Capitalizing string:

```
1.
2. // capitalize first letter in each word of a string
3. void strcap ( char * str ) {
4.
5.     int i;
6.     for(i=0 ; i<strlen(str) ; i++) {
7.
8.         // captlize lowercase alphabets if being firt letter or preceded by a space
9.         if ( ( (i==0) || isspace(str[i-1]) ) && (str[i]>='a') && (str[i]<='z') )
10.             str[i]=toupper(str[i]);
11.     }
12. }
```

### 3. Menus C/Header File (*menu.c / menu.h*)

The `menu.h` contains one main menu and three sub menus:

- `mainMenu()`
- `bookMenu()`
- `memberMenu()`
- `adminMenu()`

A “c” file which contains all menus and submenus functions which will be used all over the program. Entering lowercase or uppercase alphabets will choosing from the options won’t matter since lines of code to manage this is implemented.

Also, entering an alphabet in lowercase, uppercase or even doesn’t matter. Even entering other words which are not available is not a big deal since the program will warn you.

---

```

1.
2.     #include <stdlib.h>
3.     #include <stdio.h>
4.     #include <string.h>
5.     #include <ctype.h>
6.     #include <conio.h>
7.     #include <windows.h>
8.     #include <time.h>
9.
10.    #include "book.h"
11.    #include "member.h"
12.    #include "admin.h"
13.    #include "menu.h"
14.    #include "utilities.h"
15.
16.
17.    void header(){
18.        system("cls");
19.        printf("\n ----- Welcome to Library System ----- n\n");
20.    }
21.
22.
23.
24.    void mainMenu(){
25.
26.        SetConsoleTitle("Library System");
27.
28.        header();
29.
30.        printf("Book\t(B)\n");
31.        printf("Member\t(M)\n");
32.        printf("Borrow\t(BR)\n");
33.        printf("Admin\t(A)\n");
34.
35.        printf("\nSave\t(S)\n");
36.        printf("Exit\t(E)\n");
37.
38.        char choice[20];
39.
40.        do{
41.
42.            printf("\n\nYour choice : ");
43.            strupr(gets(choice));
44.
45.
46.
47.            if( strcmp(choice,"B")==0 )
48.                bookMenu();
49.
50.            else if( strcmp(choice,"M")==0 )
51.                memberMenu();
52.
53.            else if( strcmp(choice,"BR")==0 )
54.                borrowMenu();
55.
56.            else if( strcmp(choice,"A")==0 )
57.                adminMenu();
58.
59.            else if( strcmp(choice,"S")==0 ) {
60.                terminateTempDataBase(true);
61.                initTempDataBase();
62.                acpMsg("Data saved successfully");
63.                mainMenu();
64.            }
65.
66.
67.

```

```

68.
69.         else if( strcmp(choice,"E")==0 )
70.             exitMenu();
71.
72.         else{
73.             errMsg("Error!\nusage: enter one of the given choices");
74.             mainMenu();
75.         }
76.
77.     }while( strcmp(choice,"B")!=0 && strcmp(choice,"M")!=0
78.            && strcmp(choice,"BR")!=0 && strcmp(choice,"A")!=0
79.            && strcmp(choice,"S")!=0 && strcmp(choice,"E")!=0 );
80. }
81.
82.
83.
84. void bookMenu() {
85.
86.     SetConsoleTitle("Library System > Book Menu");
87.
88.     header();
89.
90.     printf("Insert\t(I)\n");
91.     printf("Search\t(S)\n");
92.     printf("Add\t(A)\n");
93.     printf("Delete\t(D)\n");
94.
95.     printf("\nBack\t(B)\n");
96.
97.     char choice[20];
98.
99.     do{
100.         printf("\n\nYour choice : ");
101.         strupr(gets(choice));
102.
103.         if( strcmp(choice,"I")==0 )
104.             insertBook();
105.
106.         else if( strcmp(choice,"S")==0 )
107.             searchBook();
108.
109.         else if( strcmp(choice,"A")==0 )
110.             addBook();
111.
112.         else if( strcmp(choice,"D")==0 )
113.             removeBook();
114.
115.

#### 4. Data Types Header File (*dataTypes.h*)

The `dataTypes.h` contains several structs related to books, borrowed books and members:

- `bookDataType`
- `memberDataType`
- `borrowedBookDataType`

All `structs` used all over the program are implemented in one header file to be included in each and every function so that it's no need to re-write them every time we implement a function

---

```

1.
2. typedef struct books {
3.
4.     char title[50];
5.     char author[50];
6.     char publisher[50];
7.
8.     struct {
9.         int day;
10.        int month;
11.        int year;
12.    }publishDate;
13.
14.    char ISBN[20];
15.    char category[25];
16.
17.    int copiesNum;
18.    int avalCopiesNum;
19.
20.    int borrowed;
21.
22. }bookDataType;

```

```

1.
2. typedef struct members {
3.
4.     struct {
5.         char first[25];
6.         char last[25];
7.     }name;
8.
9.     struct{
10.        int building;
11.        int street;
12.        char city[25];
13.    }address;
14.
15.    char ID[20];
16.
17.    char phoneNum[20];
18.
19.    int age;
20.
21.    char email[100];
22.
23.    int borrowedBooks;
24.
25. }memberDataType;

```

```

1.
2. typedef struct borrowedBook {
3.
4.     char ISBN[20];
5.     char ID[20];
6.
7.     time_t borrowDate;
8.     time_t dueDate;
9.
10. }borrowedBookDataType;
11.

```

## 5. Book Header File (*book.h*)

The `book.h` contains several functions related to book actions:

- `insertbook ( )`
  - `searchbook ( )`
  - `removebook ( )`
  - `addbook ( )`
  - `showbookdetails ( )`
  - `showborrowedbookdetails ( char * ISBN )`
  - `duplicateISBN ( char * enteredISBN )`
-

## 5.1. Inserting Book (*insertbook.c / insertbook.h*)

```
1.
2. void insertBook() {
